

water supply. By allowing users to submit service requests and report issues, the application fosters quick response and resolution by the water supply authorities. Moreover, it often includes educational resources and tips to promote water conservation practices among users. Overall, a water supply mobile application empowers users to actively participate in managing their water consumption, while also contributing to sustainable water usage practices for a healthier environment.

1.2 PROBLEM STATEMENT

To develop a system that includes,

- **Lack of User Engagement:** Current water supply management systems often lack user engagement and fail to provide individuals with the necessary tools and information to actively manage their water consumption and contribute to conservation efforts.
- **Limited Real-time Information:** Users face challenges in accessing real-time information about their water usage patterns, bill status, and potential issues such as leaks or abnormal consumption. This lack of timely information hampers their ability to take immediate action and prevent wastage.
- **Inconvenient Bill Payments:** The traditional process of paying water bills often involves physical visits to payment centers or complex procedures. This inconvenience leads to delays in bill payment and can result in additional charges or service interruptions.
- **Lack of Reporting Mechanisms:** Users encounter difficulties in reporting water-related problems, such as leaks, pipe bursts, or water quality concerns. The absence of centralized reporting mechanisms makes it challenging for water supply authorities to quickly respond and address these issues.
- **Limited Water Quality Information:** Users often lack access to comprehensive and up-to-date information about the quality and safety of their water supply. This hinders
