

between the process engine and the software. Processes that are executed by both humans and machines are also called human interaction workflows. Process engines can technically be used wherever processes can be automated. But automation is best used for recurring and regularly running processes. In an SAP system, for example, it is not necessary to navigate from the screen for creating an order to the screen for creating an invoice using a menu tree or transaction numbers—a process engine can be used to automatically navigate from screen to screen for doing something like creating an invoice.
