

Chapter 8

SYSTEM GOAL

A smart mobile application can help to identify and repair leaks in the water supply network, reducing the amount of water that is lost. This app can provide customers with real-time information on their water usage, as well as allow them to report any issues or make requests. By providing users with information on their water usage and tips on how to use water more efficiently, the app can help to promote water conservation and also by improving efficiency and reducing water waste, the app can help water utilities to save money on resources and operations. In the event of a water-related emergency, the app can help utilities to quickly identify and address the issue, minimizing disruption to customers. This app can provide real-time data on water usage, allowing utilities to better understand trends and patterns in water consumption. This can inform decision-making and help to optimize water management strategies.

The system is designed to provide a comprehensive and user-friendly platform for effective water management and reliable water delivery. The programme seeks to empower users by allowing them to efficiently track and manage their water consumption. Users can obtain insights into their water usage habits and make informed decisions to conserve water by using features such as real-time water usage tracking, consumption goal setting, and personalised conservation advice. Furthermore, the application aims to improve transparency and communication by giving up-to-date information on the state of water delivery, including any disruptions or repair schedules. Users can be informed about potential difficulties, such as water outages or contamination, by receiving timely warnings and updates, and have an estimate of when these problems are expected to be rectified.
