

help water supply management applications to make more accurate predictions and better decisions by analyzing vast amounts of data from multiple sources.

- Internet of Things (IoT): IoT sensors can be used to monitor water quality, usage, and availability in real-time, enabling water managers to quickly identify and address issues before they become major problems.
- Blockchain: Blockchain technology can be used to track and verify water usage and transactions, ensuring that water resources are allocated fairly and transparently.

Every innovation in this world tries to help the human kind. This application would ease the process of providing water for people in the metropolitan city where there is a great need of water. It also maintains a good relationship between people and dealers at low cost. This proposed application has been partially implemented and has been uploaded in the Google Play store.
