

ABSTRACT

India has experienced a serious water shortage for the past three years. Purchasing water has become truly sensitive and priceless. People then completely rely on water power through exchanges. This programme aids in overcoming the water shortage, facilitating water swaps, direct communication with suppliers, and access to all relevant data regarding water suppliers, volume, and price. The Global Positioning System (GPS) is used in this work to track your location and show all the water suppliers nearby. A stoner friendly mobile operation is developed using Android Studio.
