

1.4 SCOPE

A mobile application for water supply can have a wide range of features and functionalities to serve its users effectively. Here are some key areas you can consider when defining the scope of a water supply mobile application. User Registration and Authentication Provide a registration process for users to create accounts and log in securely. This allows you to personalize the experience and maintain user data. Water Quality Information which include a feature to provide real-time information about water quality, such as pH level, contaminants, and any relevant health advisories. This can be based on official data from water testing agencies or user-reported data. Water Availability and Consumption Tracking which allow users to track their water consumption patterns and receive notifications/alerts when water supply is disrupted or scheduled maintenance is planned. Provide data visualizations and historical usage reports to help users understand and manage their water consumption. Water Service Requests the users to submit service requests related to water supply issues, such as leaks, low pressure, or water contamination. Include a feature to track the progress of their requests and receive updates. Bill Payments will incorporate a payment gateway to allow users to pay their water bills directly through the application. Provide payment history and digital receipts for reference.

1.5 PROJECT MANAGEMENT

- The Project scope: This includes identifying the goals of the project, the target audience, and the features that will be included in the application.
- A Team: This will involve identifying the skills and experience that are needed for the project, and recruiting the right people to join the team.
- A Project Plan: This will include a timeline for the project, a budget, and a list of tasks that need to be completed.
