

4.1.1 Admin

To access the application, the admin must provide a valid username and password. Once logged in, the admin has various permissions, such as adding or rejecting supplier, viewing user list, view payment, view feedback and booking activities. These options give the admin greater control and oversight over the operations of the application, making it a valuable tool for managing and maintaining the integrity of the system.

4.1.2 User

The users are provided with the option to log in to their account using their unique username and password. Upon successful validation of the credentials, the user can access various features such as editing their profile, viewing supplier's, viewing booking details, viewing payment, viewing feedback and viewing prediction. and However, if the login credentials are invalid, the users will not be able to access these features.

4.1.3 Supplier

The suppliers are provided with the option to log in to their account using their unique username and password. Upon successful validation of the credentials, the supplier can access various features such as editing their profile, viewing booking details, viewing payment, and viewing feedback. and However, if the login credentials are invalid, the suppliers will not be able to access these features.

4.1.4 Process Engine

With a process engine, processes are executed in a predefined sequence or workflow. A process must therefore exist for the process engine to work. The engine executes each process activity and each connector within the process one after the other and performs the corresponding work step. The activities that are performed during process execution can be performed by machines. In order for the machines, there must be an exchange
